```

8 Upper Lower

- For each edge in original flow:
 - Add edge with cap = upper bound - lower bound.
- Add source s, sink t.
- Let $M[v] = (\text{sum of lower bounds of ingoing edges to } v) - (\text{sum of lower bounds of outgoing edges from } v)$.
- For all v, if $M[v] > 0$, add (s, v, M), else add (v, t, -M).
- If all outgoing edges from S are full --> feasible flow exists, it is flow + lower bounds.

Feasible flow in network with upper + lower constraint, with source & sink :

- Add edge (t, s) with capacity [0, INF].
- Check feasible in network without source & sink.

Max flow with both upper + lower constraints, source s, sink t: add edge (t, s, +INF).

- Binary search lower bound, check whether feasible flow exists WITHOUT source / sink

9 Alternative Tree

11 Euler Path

NOTES:

- When choosing starting vertex (for calling find_path), make sure $\deg[\text{start}] > 0$.
- If find Euler path, starting vertex must have odd degree.
- Check no solution: $SZ(\text{path}) == n\text{Edge} + 1$.
- If directed:
 - Edge $-->$ int
 - add_edge(int a, int b) { adj[a].push_back(b); }
 - Check for no solution:
 - - for all u, $|\text{in_deg}[u] - \text{out_deg}[u]| \leq 1$
 - - At most 1 vertex with $\text{in_deg}[u] - \text{out_deg}[u] = 1$
 - - At most 1 vertex with $\text{out_deg}[u] - \text{in_deg}[u] = 1$ (start vertex)
 - - BFS from start vertex, all vertices u with $\text{out_deg}[u] > 0$ must be visited

```

void manacher() {
    memset(p,0,sizeof p);
    int center = 0, right = 0,mi;
    for (int i = 1; i < n; i++) {
        mi = 2 * center - i;
        if (right > i) p[i] = min(right - i, p[mi]);
        while (a[i+(1+p[i])] == a[i-(1+p[i])]) p[i]++;
        //printf("%d:%d\n",i,p[i]);
        if (i + p[i] > right) {
            right = i+p[i];
            center = i;
        }
    }
}

```

20 DP knuth

<http://codeforces.com/blog/entry/8219>

Original Recurrence:

$dp[i][j] = \min(dp[i][k] + dp[k][j]) + C[i][j]$ for $k = i+1..j-1$

Necessary & Sufficient Conditions:

$A[i][j-1] \leq A[i][j] \leq A[i+1][j]$

with $A[i][j]$ = smallest k that gives optimal answer

Also applicable if the following conditions are met:

1. $C[a][c] + C[b][d] \leq C[a][d] + C[b][c]$ (quadrangle inequality)
2. $C[b][c] \leq C[a][d]$ (monotonicity)

for all $a \leq b \leq c \leq d$

To use:

Calculate $dp[i][i]$ and $A[i][i]$

```

FOR(len = 1..n-1)
    FOR(i = 1..n-len) {
        j = i + len
        FOR(k = A[i][j-1]..A[i+1][j])
            update(dp[i][j])
    }

```

// OPTCUT

#include "../template.h"

const int MN = 2011;

int a[MN], dp[MN][MN], C[MN][MN], A[MN][MN];

int n;

void solve() {

```

    cin >> n; FOR(i,1,n) { cin >> a[i]; a[i] += a[i-1]; }
    FOR(i,1,n) FOR(j,i,n) C[i][j] = a[j] - a[i-1];

```

```

    FOR(i,1,n) dp[i][i] = 0, A[i][i] = i;

```

```

    FOR(len,1,n-1)

```

```

        FOR(i,1,n-len) {
            int j = i + len;
            dp[i][j] = 2000111000;
            FOR(k,A[i][j-1],A[i+1][j]) {
                int cur = dp[i][k-1] + dp[k][j] + C[i][j];
                if (cur < dp[i][j]) {
                    dp[i][j] = cur;
                    A[i][j] = k;
                }
            }
        }
    }

```

```

    cout << dp[1][n] << endl;

```

}
